Description of the Philogen Group

Philogen is an Italian-Swiss company active in the biotechnology sector, specialized in the research and development of pharmaceutical products for the treatment of diseases with a high lethality rate. The Group mainly discovers and develops targeted anticancer drugs, exploiting high-affinity ligands for tumor markers (also called tumor antigens). These ligands – human monoclonal antibodies or small organic molecules – are identified through *Antibody Phage Display Libraries* and *DNA-Encoded Chemical Libraries* technologies.

The Group's main therapeutic strategy for the treatment of these diseases is represented by what is known as *tumor targeting*. This approach is based on the use of ligands capable of selectively conveying very powerful therapeutic active ingredients (such as, for example, pro-inflammatory cytokines) to the tumor mass, sparing healthy tissues. Over the years, Philogen has mainly developed ligands based on monoclonal antibodies, specific for antigens expressed in blood vessels associated with tumors, but not expressed in blood vessels associated with healthy tissues. These antigens are usually more abundant and more stable than those expressed directly on the surface of cancer cells. This approach, known as *vascular targeting*, is used for most of the projects pursued by the Group.

The Group's goal is to generate, develop and commercialize innovative products for the treatment of diseases for which medical science has not yet identified satisfactory therapies. This is achieved by leveraging (i) proprietary technologies for the isolation of ligands that react with antigens present in certain diseases, (ii) experience in the development of products targeting tissues affected by the disease, (iii) experience in the production and development of drugs and (iv) the broad portfolio of patents and intellectual property rights.

Although the Group's drugs are mainly oncological applications, the *targeting* approach is potentially applicable to other diseases as well, such as certain chronic inflammatory diseases.
